AI Product Manager, trained as an architect

Hello, I'm WENYUAN.

AI Product Manager, trained as an architect

I'm Wen Yuan Li (Alnt Med). Trained as an architect, now building AI products — I run a department agent platform at XTOOL and build my own. Architecture taught me to turn scattered needs into a stable system; AI product work is where that method meets real scenarios.

EDUCATION

2025 – Shenzhen University · M.Arch, architecture × AI — the pivot to AI product

2020–2025 Guangzhou University · B.Arch

EXPERIENCE

2026 XTOOL · AIPM intern · Co-work agent platform, zero to one (65 people across 4 departments, 80%+ completion)

2025 Puwei Tech · AI product intern (vertical RAG agents)

2025 UABB Bi-city Biennale · multimodal AIGC lead · sole student representative

2025 Architectural Journal (T1) · second author, AIGC spatial optimisation

AWARDS

Challenge Cup · Grand Prize TOP 1%

Lanqiao Cup, national software competition · National First Prize TOP 1%

Shenzhen–Tsinghua AI Agent Hackathon · 2nd runner-up TOP 3%

CUHK Enterprise Agent Hackathon · Runner-up TOP 5%

NCDA National Digital Design Award · First Prize

SKILLS

PRODUCT AI coding (Claude Code / Cursor) · prototyping (Figma / Axure / ClaudeDesign) · PRD

DATA SQL · Python · A/B testing · AI eval sets · Apify · Excel pivots

ORCHESTRATION Coze · n8n

MULTIMODAL Tripo 3D · ComfyUI · Jimeng · Midjourney · UE5

PEARS.

Browser extension · PRD distillation · Workflow agents

Hi, I'm Pears 🍏 — show me your work once, and I turn it into a workflow agent of your own.

PROJECT

01 Pears ■

02 Co-work

03 Yijian

04 Meco

05 UABB

06 Architecture

The Short Version

- **Interning at XTOOL**, I saw one dev team that could never keep up with the whole company's agent requests.
- I wanted to lower the bar from "describe your work to an AI" to "just do it once."
- I built a browser extension solo, zero to launch: it watches you work, distills the trace into an editable PRD, and has an AI coding agent build your own workflow agent.
- It took 2nd runner-up at the ADVENTURE-X hackathon and drew some of the most enterprise interest on site.

■ ADVENTURE-X Hackathon · 2nd runner-up

Co-work.

Agent platform · Feishu · RAG · ROI dashboard

The Short Version

- **At XTOOL**, the department's output was dragged down by repetitive work and processes that ran on human legs.
- My job was to turn that manual effort into agent workflows — and I was the only one on it.
- **I interviewed each team**, broke down their needs, and built the department's agent platform zero to one: seven production tools covering the content pipeline, iterated three generations on analytics.
- It now serves 65 people across 4 departments at an 80%+ completion rate; my own ROI dashboard shows \$1 in saves 0.39 work-hours.

SEVEN TOOLS, ONE MEMORY.

Hi, I'm Co-work — the department's agent workbench: seven tools sharing one memory, one rulebook, one pool of data.

SCENE 01 · RESEARCH AGENT

Why

- Teams kept getting stuck in the same places: hunting for assets, drafting from scratch, chasing reviews — all repetitive.
- Point tools can't fix that: without shared memory and rules, every tool has to be re-taught. What was needed was a system, not a pile of tools.

Output · suggested price on the market curve

Pricing mode · cost and benchmark in

Comparables · live listings, line by line

Key Contributions

- **Zero to one**, solo: research, requirement breakdown, product definition, build and operations in one pair of hands.
- Analytics showed a 52% drop-off at the hook stage; my read was that high-creativity content can't be nailed in one shot — so I merged the generation stages and shipped three candidates side by side, driving three generations of iteration.
- Built the ROI dashboard myself, turning "how much did we save" into an auditable number.

③ Three candidates

How It Works

- **Kick off:** colleagues file requests right inside Feishu, never leaving their daily tool.
- **Generate:** agents pull external data and the RAG knowledge base; high-creativity steps ship three candidates for a human to pick.
- **Return:** results flow back into Feishu, closing the loop; all seven tools share one memory, one rulebook, one pool of data.
- **Measure:** every step is instrumented — completion rate, time cost and hours saved land in the ROI dashboard.

Impact

- Sixty-five people across four departments at 80%+ completion — this never stopped at the demo stage; it is genuinely in use.
- Every \$1 in saves 0.39 work-hours, above the 2026 enterprise average of 0.2–0.3.

Yijian. ↗

Multi-agent · Four-layer consensus · Auditable verdicts

Hi, I'm Yijian — hand me a decision, and I orchestrate the viewpoints until disagreement converges into one auditable verdict.

PROJECT

01 Pears

02 Co-work

03 Yijian ■

04 Meco

05 UABB

06 Architecture

The Short Version

- Corporate decision meetings often devolve into position-taking; the real disagreements stay unspoken, and seniority settles the verdict.
- At CUHK's enterprise agent hackathon, I owned product and build, trying to give "reaching consensus" an actual structure.
- It orchestrates seven role perspectives and converges disagreement through four layers: strategic goals, factual evidence, stakeholders, and weighted accountability.
- We took runner-up; the output isn't one sentence but a consensus score, the conditions the decision must satisfy, and the disagreements still open.

Meco.

Mushroom butler · One process · Five boards

Hi, I'm Meco 🍄 — the mushroom butler Wenyan built for himself: a Mac app tying together a Feishu bot, a desktop window, a scheduler and his Obsidian vault, so his daily life runs itself.

PROJECT

01 Pears

02 Co-work

03 Yijian

04 Meco ■

05 UABB

06 Architecture

The Short Version

- At the busiest point of my job hunt, my life was scattered across Feishu, my notes and my calendar — moving information around ate almost an hour a day.
- I didn't want yet another app. I wanted one thread through them all — an AI that runs things for me, instead of me babysitting the tools.
- **So I built Meco alone**, as one Mac app: a Feishu bot, a desktop window, a scheduler and my Obsidian vault wired into one, plus 8 tools it can actually use.
- Now the morning brief and evening review run themselves. I open the window and today is already laid out.

UABB.

ComfyUI · Gemini · Tripo · 3D asset SOP

Hi, I'm the multimodal pipeline behind UABB — turning one-off exhibits into standard 3D assets is my day job.

PROJECT

01 Pears

02 Co-work

03 Yijian

04 Mecó

05 UABB ■

06 Architecture

The Short Version

- The biennale section held 50+ one-off exhibits; translating them by hand runs 30 days minimum.
- I owned multimodal AIGC and had to turn all of them into usable 3D assets before opening.
- I orchestrated Gemini and Tripo through ComfyUI into an automated translation pipeline, backed by a standardized 3D-asset SOP — with 120+ sketch and model iterations behind it.
- Processing fell from 30 days to 5; as the section's only student representative, I presented the pipeline on-site.

■ UABB 2025 · Sole student representative of the section
